

2

(ii) a membrane system adhering to said electrochemically active surface and having an outer surface;

(b) at least one nub of dielectric material extending outwardly from said electrochemically active surface and serving as a supportive structure to said membrane system, said membrane outer surface drooping toward said electrochemical surface as it extends away from said nub.

2. (Original) The sensor of claim 1, wherein said at least one nub is in the form of a plate.

3. (Original) The sensor of claim 1, wherein said electrochemically active surface is defined as part of a lengthwise body.

4. (Original) The sensor of claim 3, wherein said lengthwise body is circular in cross-section.

5. (Original) The sensor of claim 4, wherein said electrochemically active surface is circumferential to said circular lengthwise body.

6. (Original) The sensor of claim 5, wherein said nubs more specifically comprise annular plates.

7. (Original) The sensor of claim 2, wherein said nubs are displaced longitudinally from said electrochemically active surface.

8. (Original) The sensor of claim 2, wherein
said membrane system includes multiple membranes.

9. (Original) The sensor of claim 2, wherein
5 said membrane system includes an enzyme layer.

10. (Withdrawn) A method of creating an analyte
sensor, comprising:

- 10 (a) providing an electrochemically active
surface;
- (b) creating at least one nub made of dielectric
material and extending transversely
outwardly from said electrochemically active
surface;
- 15 (c) applying a liquid to said electrochemically
active surface and said at least one nub;
- (d) curing said liquid; and
- (e) whereby said at least one nub serves to
support said liquid before and during said
20 curing.

11. (Withdrawn) The method of claim 10, wherein
said at least one nub is in the form of a plate.

25 12. (Withdrawn) The method of claim 10, wherein
said electrochemically active surface is defined as part of
a lengthwise body.

13. (Withdrawn) The method of claim 10, wherein
30 said lengthwise body is circular in cross-section.

14. (Withdrawn) The method of claim 13, wherein said electrochemically active surface is circumferential to said circular lengthwise body.

5 15. (Withdrawn) The method of claim 14, wherein said nubs more specifically comprise annular plates.

16. (Withdrawn) The method of claim 10, wherein said nubs are displaced longitudinally from said
10 electrochemically active surface.

17. (Withdrawn) The method of claim 10, wherein said membrane system includes multiple membranes.

15 18. (Withdrawn) The sensor of claim 10, wherein said membrane system includes an enzyme layer.

19. (Withdrawn) The sensor of claim 10 wherein said at least one nub is created by first providing a wire
20 coated with dielectric material and then removing a portion of said dielectric material formed as a said nub.
